

ABSTRACT OF THE DISCLOSURE

A cleaning roller. The roller comprises a shaft, a sponge sleeve, and an inflatable chamber. The sponge sleeve encloses the shaft, and the inflatable chamber is disposed between the shaft and the sponge sleeve. A central portion of the inflatable chamber is thicker than the ends of the inflatable chamber. The inflatable chamber is of elastic materials. By introducing a working flow into the inflatable chamber, the thickness of the central portion of the inflatable chamber can be adjusted.
